Computer Architecture

Fall, 2019

Week 4

2019.9.30

Group:

```
組員簽名:____
[group2] (對抗賽)
Please translate the following C code into MIPS assembly code(i in $s1):
1.
         switch(i){
             case 1: i++;
                   break;
             case 2: i+=2;
                   break;
             case 3: i+=3;
                   break;
         }
Ans:
             addi $s4, $zero, 1
             bne $s1, $s4, C2_COND
             j C1_BODY
C2_COND: addi $s4, $zero, 2
             bne $s1, $s4, C3_COND
             j C2_BODY
             addi $s4, $zero, 3
C3_COND:
             bne $s1, $s4, EXIT
             j C3_BODY
            addi $s1, $s1, 1
C1_BODY:
             j EXIT
            addi $s1, $s1, 2
C2_BODY:
             j EXIT
C3_BODY:
            addi $s1, $s1, 3
EXIT:
```

[group3] (對抗賽)

 Please convert the following hexadecimal number to binary number, and(1)disassemble the machine code to assembly language in MIPS.(2)Which type is this instruction format?
 2213FFA8₁₆

Ans:

(1)

 $001000\ 10000\ 10011\ 11111111110101000$

Addi \$19 \$16 -88

(2)

I-Format instruction

[group5]

- 3. 下列有關 MIPS instructions 何者正確?
 - (A) R-format 與 I-format 的 rt field 是意義相同的
 - (B) I-format 的 immediate field 可以表示 $\pm 2^{15}$ 的數字,最左邊的 bit 如果是 1 的話代表是正數,0 為負數
 - (C) I-format 進行 load 與 store 的時候, base register 永遠放在 rs field
 - (D) shift right logical 補 0,而 shift right arithmetic 補 1

Ans: (**C**)

[group7] (對抗賽)

- 4. 關於 MIPS 的指令,以下敘述何者正確?如果敘述錯誤,請簡述原因。
 - (A) MIPS 有"branch on less than"的指令
 - (B) beq 跟 j 都屬於一種決策指令,只是前者是有條件的,後者是無條件的
 - (C) beq 跟 j 都屬於 J-type instrution format.
 - (D) R-type instrution format 中的 shamt field 有 6 bits.

Ans: (B)

[group11]

5. What is the MIPS machine language code for these three instruction?

```
lw $t0, 1200($t1)
add $t0, $s2, $t0
sw $t0, 1200($t1)
```

Ans:

Binary:

ОР	rs	rt	rd	shamt	funct
100011	01001	01000	0000 0100 1011 0000		
000000	10010	01000	01000	00000	100000
101011	01001	01000	0000 0100 1011 0000		

[group8] (對抗賽)

6. **(1)** 由於 MIPS 不提供 branch if greater and equal than(bge),但我們可以藉由使用 beq,bne,slt 等指令 將其造出,則 bge \$s1,\$s2,L1 在 MIPS 中可以寫成?

Ans:

slt \$t0,\$s1,\$s2 beq \$t0,\$zero,L1

(2) \$t0 = 0x55555555, \$t1 = 0x12345678, 在經過以下順序的指令後,\$t2 的值為? sll \$t2,\$t0,4 or \$t2,\$t2,\$t1

Ans:

0x57755778

[group6] (對抗賽) (

7. Translate the following loop into C. Assume that the C-level integer i is held in register \$11, \$s2 holds the C-level integer called result, and \$s0 holds the base address of the integer MemArray.

```
add $t1, $0, $0

LOOP: lw $s1, 0($s0)

add $s2, $s2, $s1

addi $s0, $s0, 4

addi $t1, $t1, 1

slti $t2, $t1, 100

bne $t2, $zero, LOOP
```

```
i = 0;
do{
    result+= MemArray[i];
    i++;
}while(i<100)</pre>
```

[group12] (對抗賽)

- 8. 請問下列敘述哪些有誤,若敘述有誤,請說明原因?
 - (a)MIPS 不存在 branch on less than
 - (b)lw 和 sw 屬於 I-format 的 instruction
 - (c)NOT a 可以視為 a NAND 0
 - (d)MIPS 的 3 個 shift instructions 分別為 sll, srl, sla
 - (e)不論是 lw 或 sw, base register 皆放在 rs field

A:

- (C) a NOR 0
- (D) sll, srl, sra, 左移不需考慮 sign

[group4]

9. Please explain R-Format Instructions' fields

Ans:

opcode: partially specifies what instruction it is

rs: the first register source operand rt: the second register source operand

rd: the destination operand which will receive result of computation

shamt: contains the amount a shift instruction will shift funct: combined with opcode to specify the instruction

Instruc	Function
